

## II. SPECIFICATION AMENDMENTS

Please replace the paragraph/section beginning on page 16, line 21 through line 27 as rewritten below:

Therefore, it is proposed that new MESSAGE\_TYPE fields are defined, which new MESSAGE\_TYPE fields require less bits and thus leave some bits available for additional fields. Since the PCA is sent on an uplink PACCH channel and only when requested by the mobile station, the message type does not need to be unique, i.e. very short indications of the message type can be used.
